San Francisco | April 20-24 | Moscone Center

SESSION ID: IDY-F03

UMA in Health Care: Providing Patient Control or Creating Chaos?

David Staggs JD, CISSP

Technologist / IP Attorney
Staggs PLLC

CHANGE

Challenge today's security thinking

UMA Value Proposition

- ◆ User Managed Access (UMA) brings granular control to the health care ecosystem
- ◆ scalable, secure, and provides uninterrupted consent
- ◆ patient control encourages trust and participation
- ◆ extends electronic workflow:
 - ◆ reduces paper
 - ◆ simplifies audit and compliance
 - ◆ multi-use workflows possible

Making Possible Real

- ◆ unlock access to electronic health records (EHR) and personal health records (PHR)
- ◆ develop an ecosystem that opens entrepreneurial opportunities and accelerates progress
- ◆ establish publicly available APIs to the software ecosystem and share vast stores of data
- ◆ the solution must respect individuals' privacy and guard against data breaches

The Future is RESTful

- ◆ RESTful Health Exchange (RHEX)
- ◆ links to specific EHR data – not just moving entire record
- ◆ allows app providers to address small practices
- ◆ adds capabilities that are missing in secure email
- ◆ uses OAuth 2 and OpenID Connect (OIDC) profiles

The Future is SMART

- ◆ Substitutable Medical Applications Reusable Technologies
- ◆ opens up the EMR system silo
- ◆ open-source, developer-friendly API
- ◆ gives application ecosystem access to data
 - ◆ encourages innovation
- ◆ uses OAuth 2 and OpenID Connect (OIDC) profiles

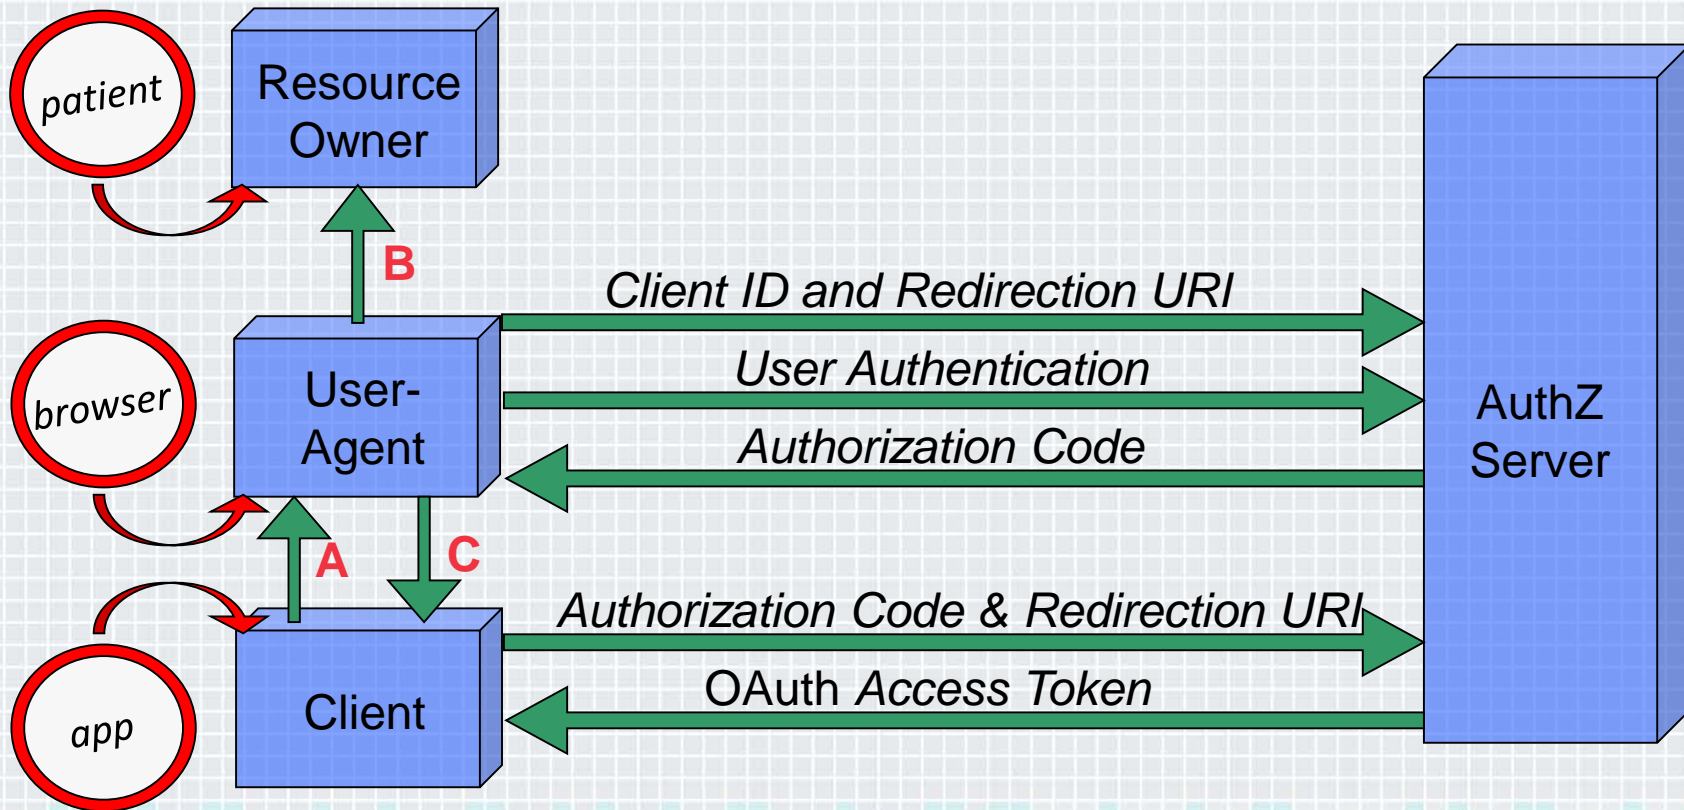

The Future is on FHIR

- ◆ Fast Healthcare Interoperability Resources
- ◆ data formats and elements with an API for exchanging EHR
- ◆ uses an HTTP-based RESTful protocol
- ◆ uses OAuth 2 for authentication to APIs
- ◆ adopted by RHEX and SMART
- ◆ supported by Health Level Seven (HL7)

OAuth 2 Authorization (Real Time) Code Grant

OAuth 2 Framework

- ◆ replaces the anti-password pattern
- ◆ resource owner OKs token for client's access
- ◆ HTTP-based RESTful protocol
- ◆ includes scopes / TTL that manage access rights
- ◆ permits service chaining (token that can be passed)
- ◆ Privacy by Design (PbD)

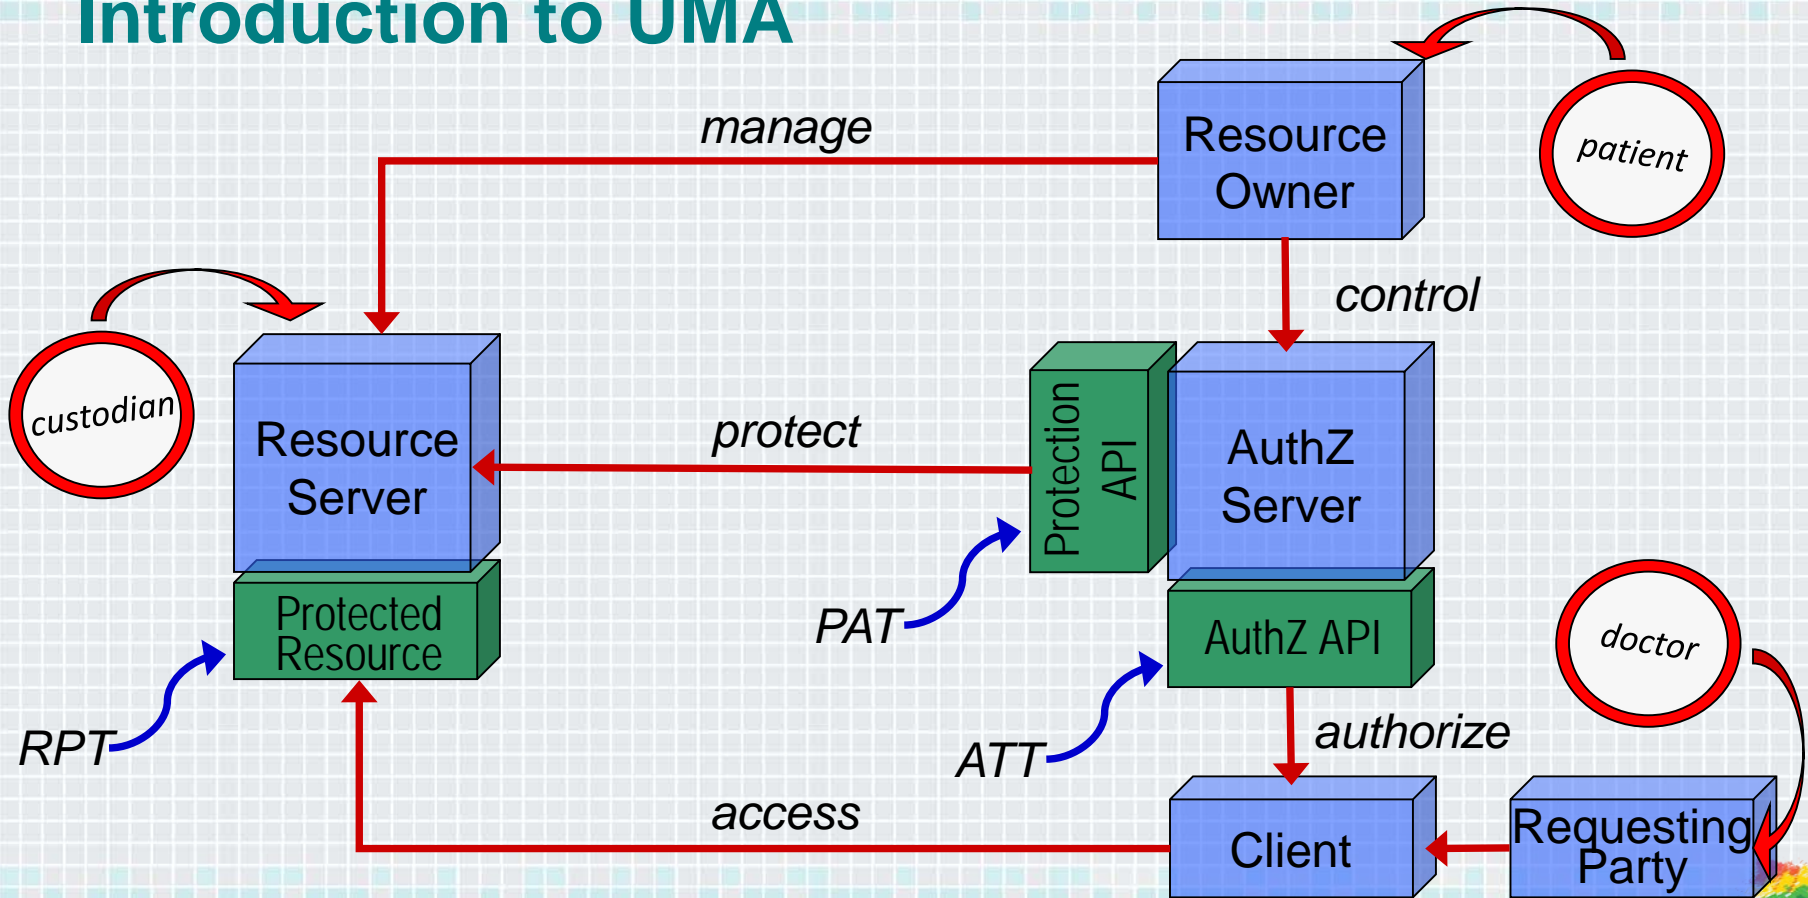

Security and Privacy

- ◆ Protected Health Information (PHI) and HIPAA
- ◆ patients should have control over their PHI
- ◆ need an extension to OAuth 2 / OIDC profiles
 - ◆ use OAuth to protect APIs and OIDC to get credentials
 - ◆ enforce patient's consent directives, even when the patient is not available (uninterrupted consent)
- ◆ User Managed Access (UMA) provides a solution

Introduction to UMA

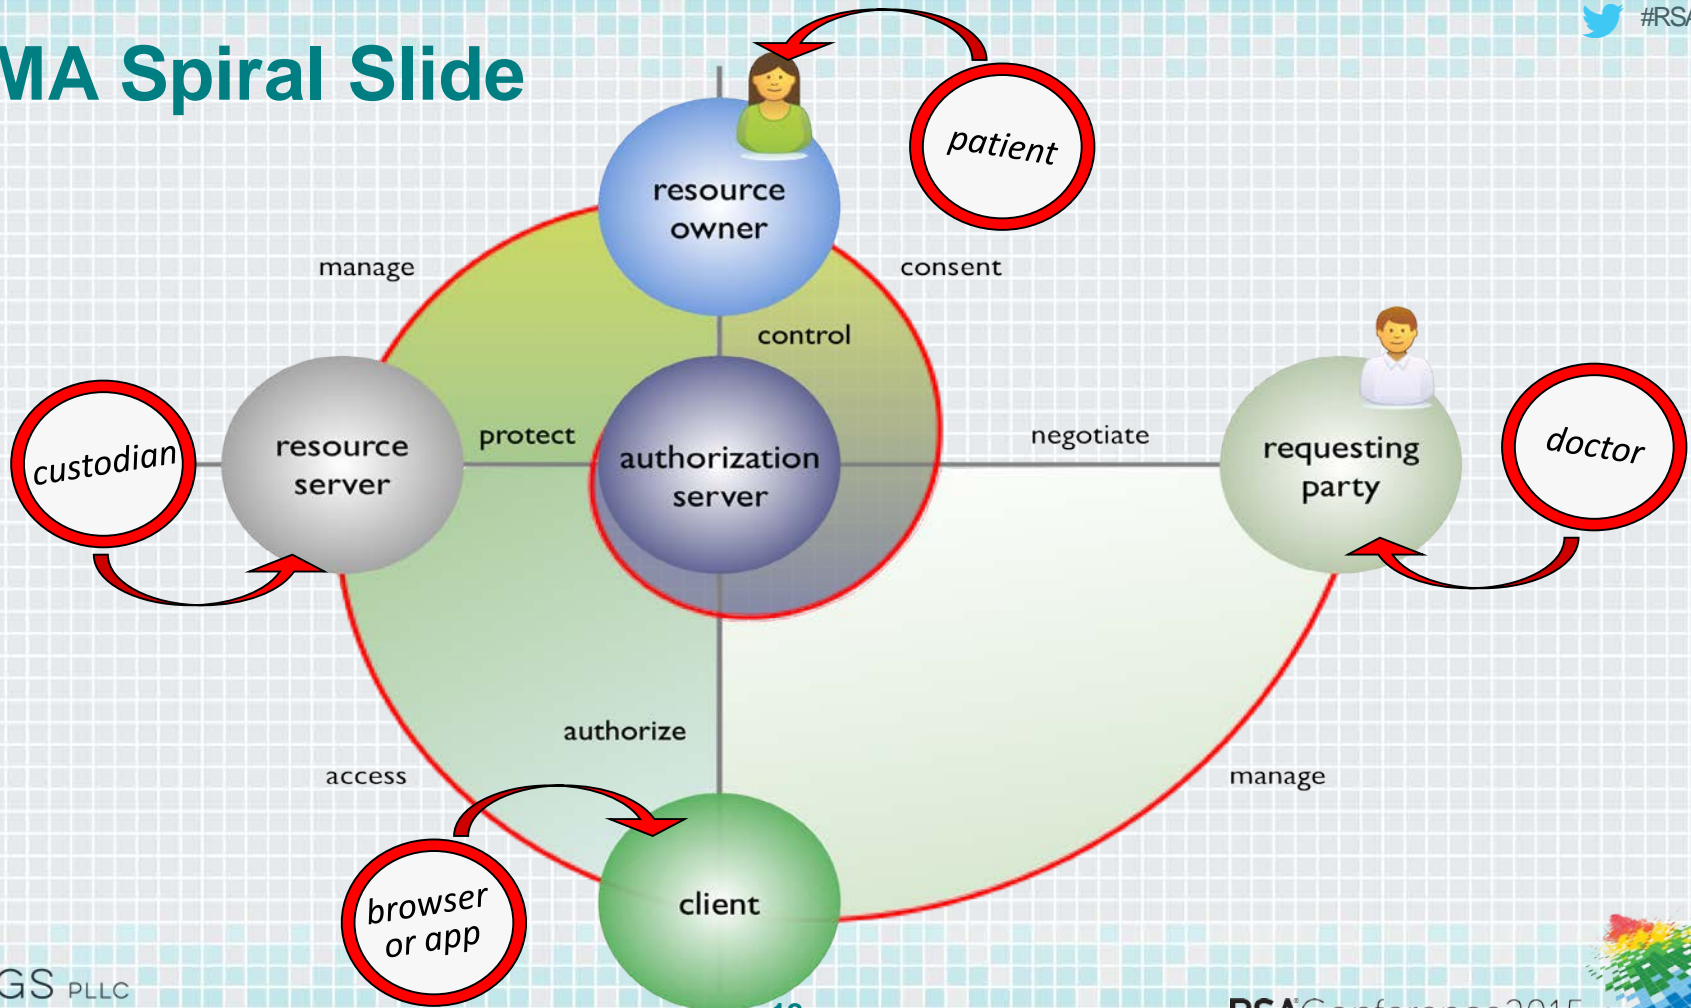

UMA OAuth Tokens

- ◆ Authorization API (AAT)
 - ◆ authorization server, requesting party, and client
- ◆ Request API (RPT)
 - ◆ requesting party, client, resource server, and authorization server (not resource owner)
- ◆ Protection API (PAT)
 - ◆ resource server, authorization server, and resource owner
 - ◆ *resource owner (e.g. patient) sets access policy and scope*

UMA Spiral Slide

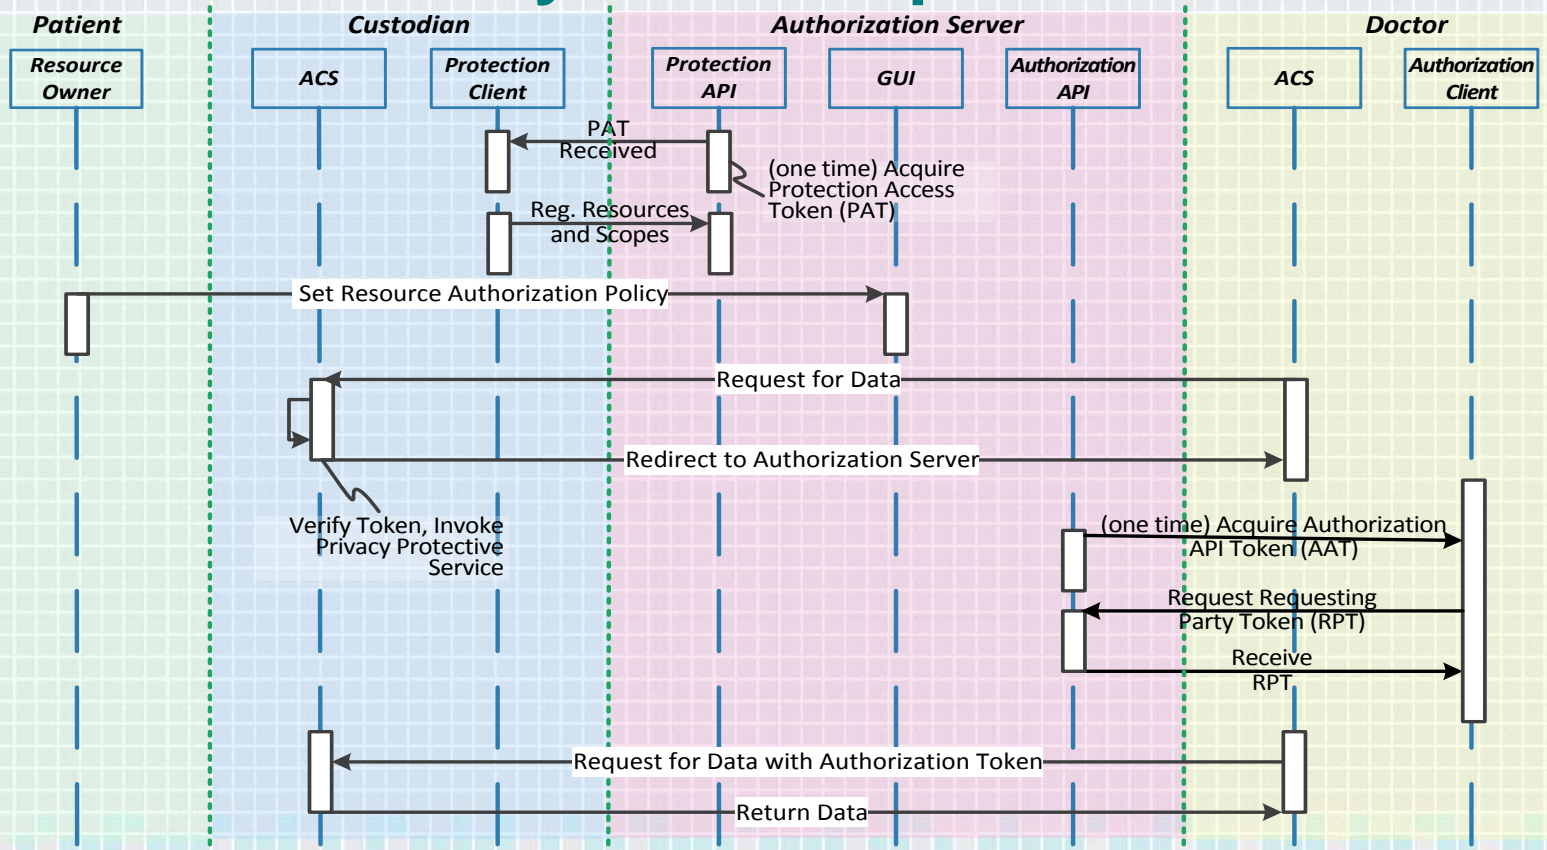

UMA's Chaotic Potential

- ◆ if patients pick their resource servers (personal cloud) how do they keep track of where everything is?
- ◆ will health care providers allow you to use any authorization server to control access to records they create?
- ◆ will treatment by multiple providers cause conflicts on which authorizations server is used to control?
 - ◆ provider/custodian A requires using only authorization server X
 - ◆ provider/custodian B requires using only authorization server Y

UMA Health Ecosystem Deep Dive

Scopes

- ◆ scopes provide finer grained control
- ◆ scopes have the following:
 - ◆ name of the resource that can be displayed to owner
 - ◆ human-readable string describing some extent of access
- ◆ for example, scope involving reading or viewing resources:

```
{  
  "name" : "View",  
  "icon_uri" : "http://www.example.com/icons/reading-glasses"  
}
```

Scope Description Documents

- ◆ scope description documents have the following:

- ◆ name, type, scopes, icon_uri

```
{  
  "name" : "Photo Album",  
  "icon_uri" : "http://www.example.com/icons/flower.png",  
  "scopes" : [  
    "http://photoz.example.com/dev/scopes/view",  
    "http://photoz.example.com/dev/scopes/all"  
  ],  
  "type" : "http://www.example.com/rsets/photoalbum"  
}
```

More Potential Chaos

- ◆ token introspection by resource server at authorization server
 - ◆ need to understand semantics of the token
- ◆ OpenID OAuth profile
 - ◆ ID Token – a signed and optionally encrypted JWT containing identity and attribute claims about the user
 - ◆ UserInfo Endpoint – a protected resource where the relying party can request additional claims about the user
 - ◆ OAuth scopes are used to request individual user attributes

Can We Just Get Along

- ◆ health records in a personal cloud spread across resource servers should have uniform scope syntax
- ◆ authorization servers' scope description documents
 - ◆ simplify resource set registration mechanism
 - ◆ prevent scope names from revealing PHI
 - ◆ is a pointer to standard scope descriptions politically possible?
- ◆ consider HEART (Health Relationship Trust)

OpenID HEART

- ◆ health-related profiles layering: OAuth 2.0, OpenID Connect, FHIR, OAuth 2.0 scopes, and UMA
- ◆ HEART WG is defining use cases and requirements
- ◆ expect an implementation guide soon
- ◆ demonstration of current capabilities
 - ◆ Eve Maler, ForgeRock, HEART WG Co-Chair

Apply Slide

- ◆ identify your use cases requiring uninterrupted consent
- ◆ use HEART open source code for a test bed
- ◆ mitigate token vulnerabilities
 - ◆ audience parameter, state parameter, signed JWTs, redirection URIs
- ◆ identify what resources need protection and define terminology
- ◆ identify your role in the ecosystem
 - ◆ patient UX, authorization server, EHR custodian, OpenID claims provider, organization offering standard scope descriptions
