# Third Party Components in Applications: Understanding Application Security

SESSION ID: MBS-W08

**Olli Jarva**

Chief Security Specialist, APAC  
Codonomicon, Singapore  
@ollijarva

**RSAC** CONFERENCE **2014**  
ASIA PACIFIC & JAPAN

## Applications and Open Source

# Open Source Components in Mobile Software

- ◆ 80-90% of mobile software consists of re-used libraries
- ◆ Most – open source
- ◆ Some – overlapping
- ◆ 26-96% of mobile software has known vulnerabilities (depending on platform and developers)
- ◆ Closed source – also subject to vulnerabilities

# Open Source Components

- ◆ No need to re-invent the wheel
- ◆ Affordable
- ◆ In theory, multiple developers means better quality
- ◆ Can be combined to create brilliant things
- ◆ End products, inherit vulnerabilities and licensing issues

# Open Sources Vulnerable

- ◆ Middleware libraries
- ◆ Common Unix-daemons
- ◆ Embeddable services
- ◆ Utility libraries
- ◆ Encryption libraries
- ◆ Kernels

*And more...*

# Vulnerabilities are Everywhere

## Where do the vulnerabilities come from?

- ◆ Immature / Malfunction processes
  - ◆ Operating systems, Applications, Anti-{malware/virus/spam} not up-to-date
  - ◆ Users fall victim to social engineering
  - ◆ Poor or incorrect configurations
- ◆ Poorly implemented software
  - ◆ Unknown (and known) vulnerabilities
  - ◆ Logic errors in implementation
  - ◆ Poor software design and architecture

# What is the Impact of These Vulnerabilities?

- ◆ Software = Bugs
- ◆ Some vulnerabilities act intentionally or unintentionally
  - ◆ Leak information
  - ◆ Behave maliciously
  - ◆ Do other nasty things behind the scenes that user is not aware of
- ◆ BYOD policies can reveal a larger issue
- ◆ How do we counter this situation?

# Who is in Charge?

- ◆ End users
- ◆ Policy-makers and their enforcers
- ◆ Developers
- ◆ *Combination of all above*

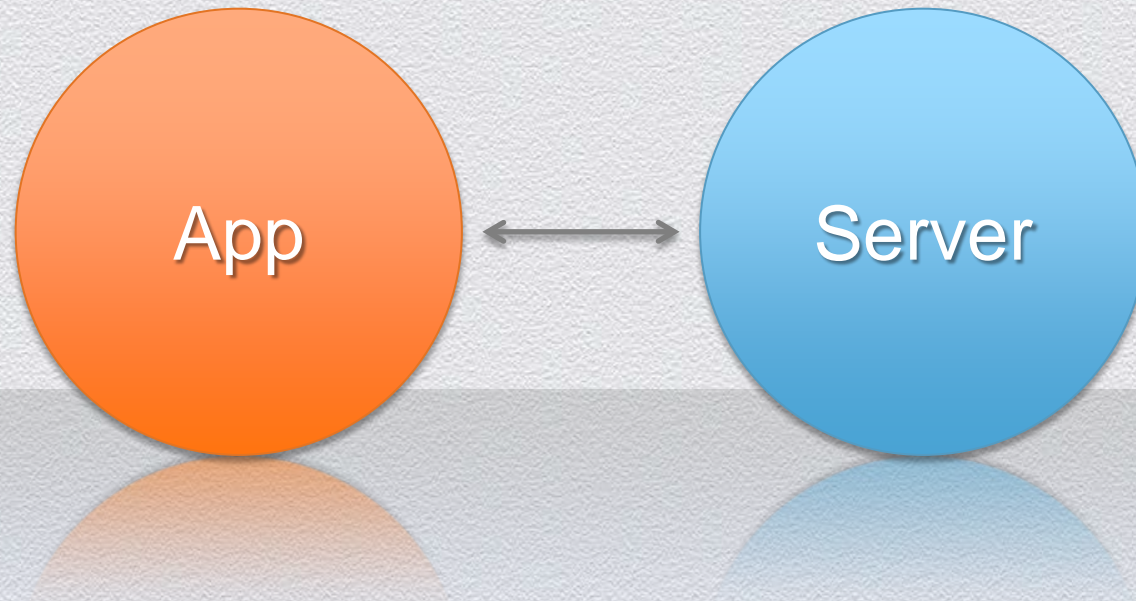

# How Do We Make Sure We Know What the Applications are Doing...

- ◆ ...Consequently, how do you choose what to use?
- ◆ Issues are invisible to the users – this all happens behind screens
- ◆ Are there any platform issues related to choosing what we have at use?
- ◆ Testing?

# Example of a Good Application Behavior

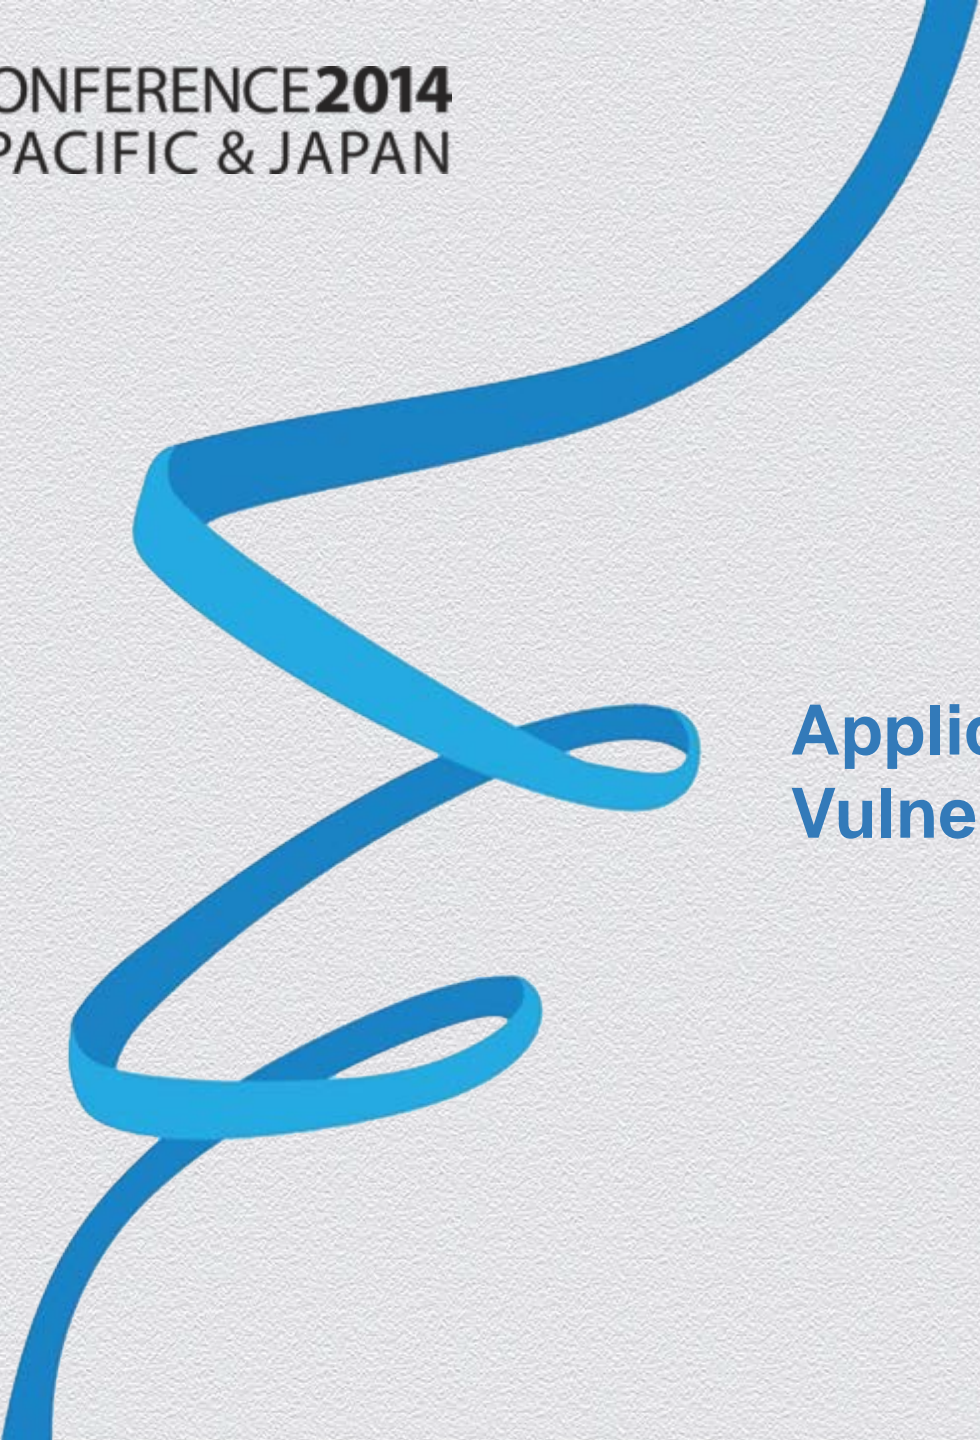

# Example of Bad Application Behavior

Application sends...

- ◆ Irrelevant information
- ◆ Too sensitive information
- ◆ To server, and also...
- ◆ Third, fourth and fifth parties

**RSAC** CONFERENCE **2014**  
ASIA PACIFIC & JAPAN

## Applications and Vulnerabilities

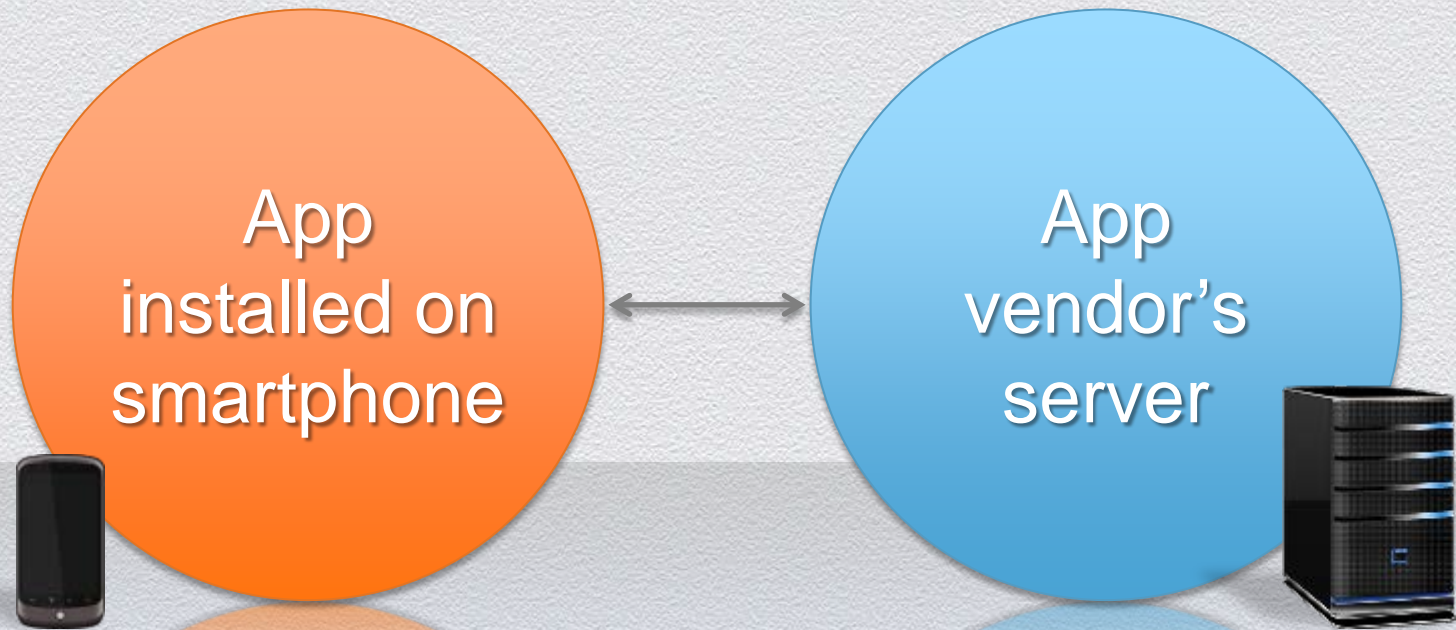

# What Makes Applications Vulnerable

- ◆ Many Mobile Applications use Open Source libraries
  - ◆ 80-90% of mobile software consists of re-used libraries
- ◆ Commonly used libraries:
  - ◆ OpenSSL
  - ◆ Image handling (PNG, TIFF and so on)
  - ◆ Curl
  - ◆ Freetype
  - ◆ Zlib
- ◆ Many Mobile Applications connect to Ad networks
- ◆ May be stack issues

# Communication in a Perfect World

# The Reality is Something Else

Private information is being shared to outsiders (IMEI, Android ID, Contacts, etc.)

# Private Information

## How Private Information is sent

# And it Just Gets Better

# When Problems Surface...

- ◆ Consider possible issues when we use Applications in BYOD environments
- ◆ New issues:
  - ◆ Privacy
    - ◆ What others are knowing about our daily life, our behavior of doing things?
  - ◆ Security
    - ◆ What might be the impact of Malicious user utilizing vulnerability in end users device, exposing company secrets?
  - ◆ Confidentiality
    - ◆ How are we limiting the access or places for certain types of information?
  - ◆ Availability
    - ◆ Is there a possibility that our availability might be compromised by Malicious application?

**RSAC** CONFERENCE **2014**  
ASIA PACIFIC & JAPAN

**Where Do We  
Stand Now?**

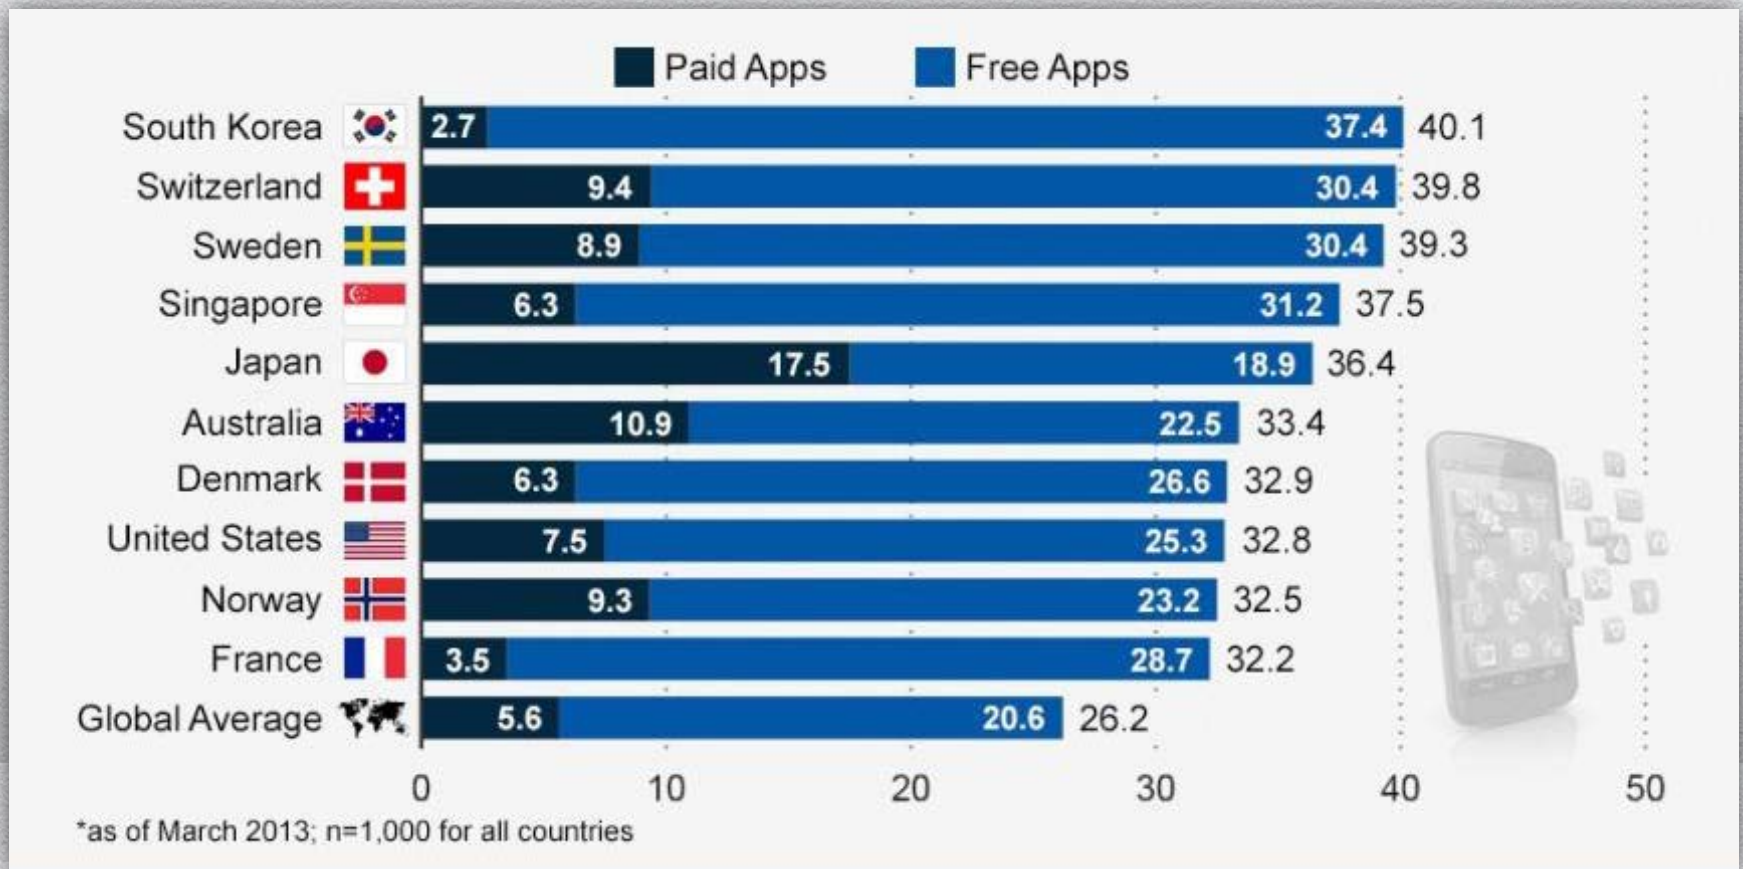

# Today's Landscape

- ◆ Top 50 android apps and their behavior
- ◆ How many Applications are connecting to Ad Networks?
  - ◆ Sharing your private information without user awareness?
    - ◆ Location
    - ◆ Contacts
    - ◆ IMEI code
    - ◆ Android ID
- ◆ How many endpoints do the applications have?
- ◆ What private information is being shared?

# Application Downloads

(Singapore Above Average, ~37 Apps)

Source: Mashable

# The Issue is Privacy – Ad Networks

## Ad Network leaks – information types that should be controlled

*Amount of Ad Networks*

# The Issue is Privacy – Mobile

**Security and Integrity:** Application morale and behavior of handling information is related to privacy

*Amount of Apps Sending Private Information*

# Five New Threats to Your Mobile Device Security

- 1 Mobile phishing and ransomware
- 2 Using an infected mobile device to infiltrate nearby devices
- 3 Cross-platform banking attacks
- 4 Cryptocurrency mining attacks
- 5 The enemy is us

- ◆ Home WiFi, work WiFi or Starbucks WiFi?
- ◆ Devices with vulnerabilities on these network...
- ◆ Can be exploited directly from the infected mobile device

# Not Only Mobile

- ◆ The Internet of Things is already here
  - ◆ Printers, network-attached storage units, wifi-routers...
  - ◆ ALSO smart TVs, consoles, connected climate control systems...

# Some Results: Network Printer

- ◆ Known vulnerabilities
- ◆ Copyleft license

### Identified licenses (8)

- Apache PERMISSIVE 3 LIBRARIES
- MIT PERMISSIVE 2 LIBRARIES
- zlib PERMISSIVE 3 LIBRARIES
- GPL COPYLEFT 2 LIBRARIES
- gsoap PERMISSIVE 1 LIBRARY
- LGPL LGPL 1 LIBRARY
- libjpeg PERMISSIVE 1 LIBRARY
- proprietary (vxworks) PROPRIETARY 1 LIBRARY

### Identified 3rd party libraries

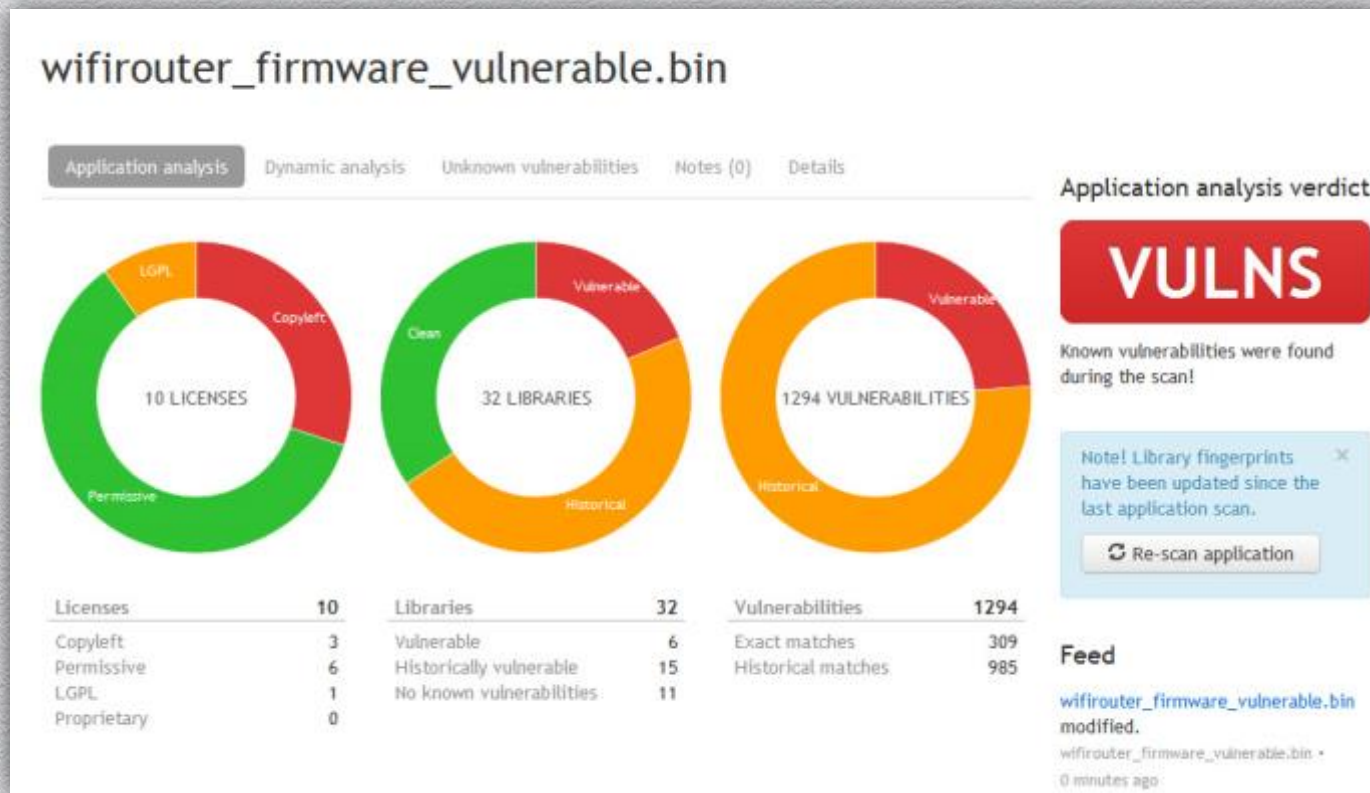

Filter Sort

- openssl 1.0.1c PROTOCOL CRYPTO 12 VULNS 66 HISTORICAL
- linux\_kernel 2.6.23-uc0\_cfs-v24.1 KERNEL 1088 HISTORICAL
- openssl 1.0.1c-fips PROTOCOL CRYPTO 18 HISTORICAL
- kerberos PROTOCOL CRYPTO 68 HISTORICAL
- curl PROTOCOL 18 HISTORICAL
- vxworks KERNEL 1 HISTORICAL

# More Results: Wireless Router

- ◆ Vulnerable libraries and restrictive licenses

# The Big Issues

- ◆ More and more devices communicating
  - ◆ Not secure enough
- ◆ Not only consumer issue – companies face similar problems
  - ◆ Smaller companies have less resources
- ◆ Unavailability, information leaks, and lost customer trust are issues
  - ◆ CEO's problem, also the CMO's problem and budget

# The Issue is Availability – Amount of Endpoints

## Compromising Availability

Without availability, privacy, integrity, confidentiality are irrelevant.  
If the systems are down, what else is there?

**RSAC** CONFERENCE **2014**  
ASIA PACIFIC & JAPAN

**We Can Fix This**

# From the Experts

- ◆ Changes can be made, yet are temporary
  - ◆ Open Source is free, yet not foolproof
  - ◆ Community effort to make libraries safer
  - ◆ Heartbleed revealed, we can make the change quickly

# Whitelisting Applications

- ◆ Challenges:
  - ◆ Enforcing white lists
  - ◆ Listing safe applications to be used
  - ◆ Maintaining the list up-to-date
  - ◆ Forcing people to consider security as a tier-one priority

# Challenges in Development

- ◆ How do we make developers aware of the issue?
- ◆ Do they already know about it?
- ◆ What is the monetary impact, how do we solve it?

# Customers' Viewpoint

- ◆ Single customer
  - ◆ Difficult as a single voice to be heard
- ◆ Demanding better and higher quality
  - ◆ Quality = higher cost
- ◆ Normally the motivating factor may not be security, until a failure occurs
  - ◆ Cheap = demand for low-end products

# What's Next?

- ◆ The requirements are clear
  - ◆ Healthier, happier, and more productive
  - ◆ Perhaps...
  - ◆ Create software that is safer, reliable, “unbreakable”
  - ◆ Create software that integrates with everything
